

The energy transition, a challenge for European sovereignty and competitiveness

Anthony Bailly
 Head of European Equity

Ludivine de Quincerot
 Head of Sustainable Investment et
 Diversified Europe

R-co 4Change Net Zero Equity Euro is a transition fund, classified under Article 9 and certified with the ISR V3 label (which notably involves the exclusion of fossil fuels). It aims for ambitious decarbonisation targets by investing across all sectors, including the most carbon-intensive ones, with the primary goal of reducing its carbon intensity by an average of 7% per year. To achieve this, we select only companies with credible decarbonisation pathways that are aligned with this objective.

Thanks to its positioning, the portfolio addresses key issues of sovereignty and competitiveness that have come to the fore since the outbreak of the Russia-Ukraine conflict. Reducing our energy dependence and developing a competitive industrial base are two essential pillars for Europe in the years ahead. This will lead to significant investment in related sectors, which the fund is well placed to benefit from, given its transition-focused approach and broad sector exposure without a marked style bias. The ambition of R-co 4Change Net Zero Equity Euro is to combine sustainable and financial performance, with the objective of outperforming its benchmark index (Eurostoxx with dividends reinvested). Its transitional positioning helps it avoid being locked into sector rotations, enabling the fund to deliver performance that places it in the top quartile of European equity funds, while also outperforming within the universe of “carbon funds”.¹

Why has reducing our energy dependence become a crucial issue for European sovereignty?

Beyond the need to rearm, the outbreak of the Russian invasion of Ukraine highlighted Europe's energy dependence on Russian gas. This dependence is mainly due to the limited fossil fuel reserves available on the Old Continent and an energy strategy that relied on strategic partners for supply. Beyond the risk associated with the suspension of these supplies, one of the consequences of this conflict, the surge in energy prices served as a precursor to a broader rise in inflation, which is the second factor undermining this strategy.

To address this issue, Europe's initial response was to turn to the United States and Middle Eastern countries to replace Russian energy supplies. Beyond concerns about the reliability of these partners, this decision has impacted the competitiveness of European companies, which now pay two to three times more for energy than their American counterparts. Moreover, high energy prices strain household budgets, especially for lower-income families, for whom energy represents a larger share of their expenses.

Current discussions around commitments to purchase American LNG (liquefied natural gas) in exchange for a "relaxation" of customs tariffs still involve colossal amounts and do not resolve the issue of dependence. Although Europe has accelerated its domestic energy production, it still imports nearly 50% of its energy, compared to 15% for the United States and 20% for China².

Energy sovereignty is a major challenge for Europe, especially in a context where the need for electricity is increasing, driven by the growth of the electric vehicle fleet (under regulatory pressure), the creation of data centers linked to AI development, and all the related data security and sovereignty concerns that require local infrastructure, which by nature is highly energy-intensive. As an illustration, Germany published a report last September assessing the progress of its energy transition. The government expects electricity demand to reach 600-700 TWh by 2030 compared to 500 TWh today, which represents a growth rate of 5% per year, well above the current consensus of 0%³.

How can European industry improve its competitiveness?

Primarily through two approaches: the deployment of energy efficiency solutions and the development of decarbonized products.

By integrating energy efficiency technologies developed by European leaders, companies can significantly enhance their competitiveness. First, reducing operational costs through optimized energy consumption improves profitability and frees up additional margins for innovation and investment, creating a virtuous cycle. Second, managing risks related to energy price volatility, particularly through electrification of uses, gives companies better visibility over their costs. Finally, these solutions allow companies to showcase their ESG

performance, which is increasingly crucial for accessing sustainable financing and meeting institutional investor requirements.

Better access to green energy will also provide European companies with a source of differentiation, a factor of competitiveness with decarbonised products in sectors as diverse as steel, chemicals, automotive and construction. The same applies to technology, with the potential to produce green energy for data centers. For example, Microsoft was one of the first to sign a major agreement in May 2024 with Brookfield to develop new wind and solar farms with a capacity of 10.5 GW to power its data centers in Europe and the United States.

What solutions can address the challenge of reducing energy dependence?

A combination of two key solutions is essential: accelerating the development of renewable energy, coupled with expanding the electricity grid and flexible generation capacity.

Europe's energy transition is experiencing remarkable momentum, by an unprecedented investment dynamic in renewable energies. The year 2024 marks a historic turning point: for the first time, global investments in clean energy have surpassed those in fossil fuels, reaching \$2,000 billion, a level higher than the fossil peak of 2016⁴.

Germany illustrates this transformation with ambition. With its technological and economic advantages, it aims for an 80% share of renewable electricity in its energy mix, compared to 60% today. This confidence is based in particular on the competitiveness of the levelized cost of electricity (LCOE), which in 2024 was 41% lower for solar and 53% lower for wind compared to fossil fuels. Additionally, renewable projects typically come online within one to two years, much faster than traditional infrastructure.

The aging fleet of gas and coal power plants in Europe reinforces the need for renewables but also presents two major challenges: grid flexibility and supply security. The incident in Spain in April 2025 highlighted the risks associated with the intermittency of renewables. To address this, strengthening interconnections between countries is crucial, as is developing flexible generation capacity. Germany, for example, plans to build 20 GW of gas-fired power plants starting in 2026 to ensure surplus generation and stabilise the grid.

Geographically, the transition is already well underway in several countries. Solar and wind account for 37% of the electricity mix in Portugal, 38% in Spain, 40% in Germany, and 33% in the United Kingdom. In France, nuclear power remains the main carbon-free source, covering more than two-thirds of electricity production.

Finally, the decentralized nature of renewables calls for a redesign of the electricity grid. Unlike conventional energy sources, renewables require infrastructure capable of

managing a multitude of production points. Investments in transmission and distribution are expected to triple or quadruple over the next fifteen years. The energy transition is clearly underway, but it demands a systemic approach, combining accelerated renewable deployment, grid flexibility, source diversification, and strengthened European cooperation. This implies massive investments that will drive growth across many sectors, at a scale not yet reflected in the valuations of the companies set to benefit.

How does a fund like R-co 4 Change Net Zero Equity Euro contribute to this transition?

Our Net Zero investment strategy is not limited to investing in renewables and utilities, but extends more broadly to all players who benefit from or accelerate the adoption of this decarbonized energy. This positioning should allow it to benefit from the growth linked to the acceleration of investments. The positioning of our R-co 4Change Net Zero Equity Euro fund is consistent with this ambition mentioned above and is illustrated through two main pillars.

Firstly, energy sovereignty requires an increase in the production of green energy and, as such, renewable energy players participate in our strategy through investments in leaders in their sector such as Orsted, Acciona Energia, EDPR. These companies have complementary portfolios of activities, both from a product or technology point of view (solar, wind, etc.), and from a geographical point of view (Northern and Southern Europe). Electrification is also addressed through investments in companies such as Eon or Enel, which play a key role in accelerating grid deployment via their transmission and distribution activities.

Secondly, strengthening the competitiveness of European companies is based on energy efficiency issues, an issue addressed by players such as Schneider Electric, Siemens and ASML, but also the production of carbon-free value-added products with Saint Gobain or Alstom, as well as carbon capture solutions, such as those proposed by Technip Energies and Vallourec. Moreover, these changes in business models are only possible thanks to a financial industry that includes players committed to financing the investments needed to support these companies. Banks such as KBC, Société Générale, Intesa San Paolo and Unicredit, for example, also play a key role.

Our role is to identify these players, assess the credibility of their strategy in favour of the transition and then select them, integrate them into our portfolio and complement the investment with a targeted engagement strategy.

For what results?

Since the fund's launch in 2019, this positioning has enabled it to achieve results that exceed the objectives we had set ourselves.

In terms of sustainability: R-co 4Change Net Zero Equity Euro has reduced its carbon intensity by an average of 15% per year since its inception—a result significantly above the Paris Agreement alignment target of -7% per year. In absolute terms, carbon emissions have been halved over five years, and the portfolio's temperature has dropped from 3.1°C to 1.9°C in just three years⁶.

In financial terms: Our transition-focused positioning helps avoid style biases—a valuable asset for protecting against sector rotations. This contrasts with many carbon-focused funds, which have been penalized in recent years due to numerous exclusions that limit management flexibility. This positioning has enabled the fund to rank in the top quartile of European equity funds, while also outperforming within the universe of “carbon funds.”

These results reinforce our conviction in the coherence of this transition positioning to meet the challenges of decarbonization on a global scale, but also of sovereignty and competitiveness at the European level.

SRI risk indicator : 5/7

The synthetic risk indicator helps assess the risk level of this product compared to others. It indicates the probability that this product will incur losses due to market fluctuations or our inability to make payments. The risk indicator assumes that you hold the product for five years. The actual risk may be very different if you opt for an early exit, and you could receive less in return. We have classified this product as risk level 5 out of 7, which is a medium-to-high risk level and primarily reflects its positioning in the Eurozone equity market. In other words, potential losses related to the product's future performance are at a medium-to-high level, and if market conditions deteriorate, our ability to make payments could be affected. This product does not provide protection against market fluctuations or a capital guarantee, meaning you could lose some or all of your investment. Before any investment, it is essential to carefully read the PRIIPS DIC and the prospectus of the UCI, and more particularly its section on risks and fees, available on the Rothschild & Co Asset Management website: am.eu.rothschildandco.com.

This analysis is not valid unless at the time of drafting this report. R-co 4Change Net Zero Equity Euro is a sub fund of the French Variable Capital Investment Company 'R-co 2,' whose registered office is 29, avenue de Messine, -75008 Paris, registered 889,511,747 RCS PARIS. The information does not presume the suitability of the presented UCIs for the profile and experience of each individual investor. Rothschild & Co Asset Management will not be held liable for any decision taken on the basis of the information contained in or inspired by this document. In case of doubt, and before any decision to invest, we recommend that you contact your financial or tax advisor. The Undertaking for Collective Investment (UCI) presented above is organised according to French law and regulated by the French financial markets authority (AMF). Investment in units or shares of any UCI is not risk free. Before any investment, it is imperative to read the DIC and prospectus of the UCI carefully, and more particularly its section relating to risks. Each investor must also ensure the jurisdictions in which the units or shares of the UCI are registered. The PRIIPS DIC/full prospectus is available on our website: www.am.eu.rothschildandco.com. The net asset value (NAV)/net inventory value (NIV) is available on our website. The figures quoted relate to past years. Past performance is not a reliable indicator of future performance and is not constant over time. The value of the investments and the income derived therefrom may vary up or down and is not guaranteed. It is therefore possible that you will not recover the amount originally invested. Variations in exchange rates may increase or decrease the value of the investments and the income derived therefrom, if the reference currency of the UCI is different from the currency of your country of residence. UCIs whose investment policy especially targets specialised markets or sectors (such as emerging markets) are generally more volatile than more general and diversified allocation funds. For a volatile UCI, the fluctuations can be particularly significant, and the value of the investment may therefore drop sharply and significantly. The presented performance figures do not take into account any fees and commissions collected during the subscription and redemption of the units or shares of the UCI concerned. The presented portfolios, products or securities are subject to market fluctuations, and no guarantee can be given as to their future performance. The tax treatment depends on the individual situation of each investor and may be subject to changes. The presented information is not intended to be disseminated and does not in any case constitute an invitation for US persons or their agents. The units or shares of the UCI presented in this document are not and will not be registered in the United States pursuant to the US Securities Act of 1933 as amended ('Securities Act 1933') or admitted under any law of the United States. These shares or units therefore must not be offered or sold in or transferred to the United States (including US territories and possessions) nor directly or indirectly benefit any 'US Person' (as understood under Regulation S of the 1933 Securities Act) or any equivalent person, as defined in the HIRE Act of 18/03/2010 and the Foreign Account Tax Compliance Act (FATCA). Although Rothschild & Co Asset Management information providers, including without limitation, MSCI ESG Research LLC and its affiliates (the "ESG Parties"), obtain information (the "Information") from sources they consider reliable, none of the ESG Parties warrants or guarantees the originality, accuracy and/or completeness, of any data herein and expressly disclaim all express or implied warranties, including those of merchantability and fitness for a particular purpose.
